Project Description:

- Literature Review: Damage detection and load rating algorithms
- Literature Review: Techniques for assessing remaining service life
- Interim Report
- Development of real-time, strain-based algorithm(s)
- Development of real-time, vibration-based algorithm(s)
- Development of real-time, fused-data algorithm(s)
- Compare and contrast result(s) from Tasks 4 through 6
- Interim Report
- Development of Statistical Models to Extrapolate Time-dependent Load Ratings
- Development of Structural Models to Quantify Extrapolations
- Final Report

Progress this Quarter (includes meetings, work plan status, contract status, significant progress, etc.):

TAC meeting was held on 1/03/2017 to report the progress of the project.

In this quarter, major efforts are made in the development of bridge deterioration model and remaining life estimation.

Anticipated work next quarter:

We will be continue working on our remaining life models, improving the SHM facilitated condition based bridge management prototype, and documenting the methodology, assumptions, and results of the life cycle analysis and remaining life estimation.

Significant Results:

A life cycle cost analysis was done and documented to justify the cost of SHM instrumentation

Circumstance affecting project or budget (Describe any challenges encountered or anticipated that might affect the completion of the project within the time, scope, and fiscal constraints set forth in the agreement, along with recommended solutions to those problems).

None.
