Project Description: Iowa State University researchers have developed precast concrete barriers that can be rapidly implemented. This initial research was funded by the Accelerated Bridge Construction-University Transportation Center (ABC-UTC) housed at Florida International University, who leads the ABC-UTC university consortium. The research project considered two different barriers to deck connection details that were designed and tested under quasi static loads to understand the load distribution and evaluate the connection performance. The first connection utilizing inclined reinforcing bars promotes durability and reparability but its initial cost is higher than the second alternative. The second connection that utilizes U-shaped reinforcing bars for connecting the precast barriers to the bridge deck is durable and cost effective, but replacement cost will be higher than the first alternative.

The scope of work outlined below in task form builds upon the results of the ABC-UTC research project noted above (to be noted for this proposed Pool Fund Plan as Phase I). It is noteworthy that there have been prior presentations/discussions with the AASHTO Subcommittee on Bridges and Structures (SCOBS T-04) and with the Transportation Research Board Subcommittee on ABC (the parent committee is AFF00) regarding the proposed work, and both groups support the need for the work and have endorsed the general scope of work outlined below.

- Task 1: Review of ABC-UTC Project (Phase I) and Finalize Details for Two Precast Barrier Concepts for Dynamic Evaluation and Development of Design Methodology
- Task 2: Conduct Numerical Modeling and LS-DYNA Simulation using Phase-I data
- Task 3: Perform Impact Load Investigation on Two Prototype Designs
- Task 4: Refine of Designs based on outcomes of from Task 3
- Task 5a: Perform Full-Scale Crash Tests on a Concrete Barrier-Deck Subassembly for Loads Corresponding to TL-4 and TL-5
- Task 6: Calibrate Numerical Models
- Task 7: Complete Parametric Study and Design Optimization
- Task 8: Development Design, Construction and Implementation Guidelines
- Task 9: Conduct Life-Cycle Performance and Cost Analysis

Progress this Quarter (includes meetings, work plan status, contract status, significant progress, etc.):

After finalizing the RFP to complete a crash test, it was distributed to potential proposal teams. Only one proposal was received that has been circulated among the members of TAC. The analysis of the Phase 1 tests were undertaken to make sure the design of the deck in the crash test will be conducted satisfactorily.

Anticipated work next quarter:

TAC will evaluate the proposal and possibly award the contract to the proposal team. Continue the analysis of the tested barrier and confirm the design details provided by the test team since any potential damage to the barrier would be detrimental to the outcomes of the crash test.

Significant Results:

The finalized RFP have two barriers – a single slope and a near-vertical design. The required analysis from the test team will determine which barrier to be crash tested. Both barriers are considered constructible and expected to meet the required performance criteria.
